ABSTRACT OF THE DISCLOSURE

5 A device for treatment of mitral annulus dilatation
comprises an elongate body having two states. IN a first of
these states the elongate body is insertable into the coronary
sinus and has a shape adapting to the shape of the coronary
sinus. When positioned in the coronary sinus, the elongate
body is transferable to the second state assuming a reduced
10 radius of curvature, whereby the radius of curvature of the
coronary sinus and the radius of curvature as well as the
circumference of the mitral annulus is reduced.
